

Save-a-Flush

Save-a-Flush is designed for use in toilet cisterns and saves one litre of water (by displacement) per flush. It does this without impairing the proper working of the cistern, harming the plumbing or affecting water quality.

Step 1: Remove lid from cistern.

Step 2: Lower the Save-a-Flush down into the bottom corner of the cistern and hold immersed for a few seconds.

Step 3: Ensure the Save-a-Flush lies towards the front of the cistern.

Step 4: Allow one hour for the Save-a-Flush to expand to full capacity.

Finished! You are now saving one litre of water every time you flush!
