

Project:	Hammersmith Bridge – Temporary Ferry Proposal
Document Title:	Land Contamination Desk Study – Technical Note
Client:	TFL
Document Reference:	102963-PEF-BAS-ZZZ-REP-EN-10010
Revision Reference:	001
Date:	03 June 2021

Introduction

This technical note has been prepared for TfL in respect to a planning application for the proposed construction of piers and pedestrian and cycle access floating walkways to a temporary ferry crossing which will operate during the repairs to the adjacent Hammersmith Bridge following its closure to all users once works on the bridge begin.

Pell Frischmann prepared a Land Contamination Desk Study (14 July 2020) for an alternative form of temporary cycle and pedestrian crossing for the scheme (Hammersmith Temporary Pedestrian and Cycle Bridge) which comprised proposals for the construction of a three-span modular steel temporary bridge supported on two bridge piers within the River Thames and extending from landing abutments on the north bank (in Fulham) across to the south bank (in Barnes). The current (temporary ferry) proposal provides an alternative form of temporary cycle and pedestrian crossing comprising floating walkways and landing stages secured via a series of steel restraining spud leg piles anchored through the riverbed. Proposals also include some limited levelling of the riverbed in the vicinity of the north shore landing stage.

The following document provides a high-level review of the existing Land Contamination Desk Study 102963-PEF-BAS-ZZZ-REP-EN-00010 (The Report) for the temporary bridge proposal, and how The Report aligns in terms of suitability (or otherwise) for use with the temporary ferry proposal. The following review will step through the existing sections of The Report and provide relevant comment accordingly. Selected sections of The Report are also provided with some slight changes to wording reflective of the context of this document.

The Report

Report Section 1 – Introduction

The Client and overall context for The Report remain the same and there are several similarities between the proposals, notably: the location of the landing areas on each bank and the nature of the works which both include piling within the riverbed and ground engineering of the north and south banks to accommodate access routes at a suitable gradient. While the objectives of the two schemes to provide pedestrian and cycle access across the Thames at this point are in alignment, the scale of the current temporary ferry proposals are notably smaller than the previous temporary bridge scheme.

Report Section 2 – The Site

The location of the current proposed scheme shares some alignment with the previous scheme, notably the approach routes on the north and south banks. The scheme as a whole (encompassing the access ramps and landing stages) is offset to the southeast from the previous (temporary bridge) proposal, most significantly on the north shore. Other details of the site surroundings and setting are broadly in line with that described within The Report.

Report Section 3 – Environmental Data Search

Sections 3.1 to 3.13 (inclusive) of The Report including: Site History, Ground Conditions, Hydrogeology, UXO and Environmental Designations, cover a broadly identical dataset to that which would apply to the current proposals and no significant differences have been identified. A slight difference is the proximity of previously recorded WW2 bomb strikes which are located within approximately 50m of the north shore landing stage. Selected sections of The Report are provided below.

3.2 Environmental Database

As part of the data search an Envirocheck (Site Sensitivity) Report, Geology Datasheet and a set of historic maps were procured from Landmark Information Group (Landmark). Copies of the Landmark products are included within Appendix A. of The Report. Selected map extracts and relevant datasheet information summaries are included within The Report text.

3.3 Site History

In order to provide an overview of the Site's history and to help identify potentially contaminative historic land uses both on-site and in the immediately surrounding area, the following historic records were reviewed:

- Historic County Series and Ordnance Survey (OS) map editions (source: Landmark); and
- Historic and recent aerial photographs (source: Google & Landmark).

North Bank

- The north bank had already been developed within the site boundary by dwellings and riverside properties by the earliest mapping in 1746.
- The earliest OS mapping from 1871 indicates that most of the land within the north bank site boundary comprised residential dwellings and Queen Caroline Street, up until their clearance and the redevelopment of this area of the site between 1951 and 1957. The immediate riverside frontage is indicated to have periodically been used as wharfs.
- The clearance of the residential dwellings within site boundary followed wider post war clearance of property in the adjacent areas, and the north bank land within the site boundary was largely redeveloped as an access street serving new residential blocks to the northwest.
- The riverside frontage within the site boundary is indicated to have been converted to green space after 1957.
- Some form of wharf and later engineering works (Queen's Wharf) are shown to have been in existence directly adjacent to the southeast north bank site boundary from the mapping in 1869 until the recent redevelopment of Riverside Studios after 2014. The mapping and insurance records details the presence of a machine shop, sheet metal shop, stores, offices and an oil fuel tank within the works.
- The newly developed Riverside Studios were constructed along the southeast site boundary following the demolition of Queen's Wharf and the original adjacent Riverside Studios in 2014.

South Bank

- The south bank is not believed to have been subject to development until the construction of the original Hammersmith Bridge in 1824 whose southern extent fell within the south bank site boundary.
- The original bridge was replaced by the current Hammersmith Bridge in 1884 following the same alignment as its predecessor.
- In 1829, the land to the west was developed by the West Middlesex Water Works Company and a reservoir was constructed immediately west of the site.
- Residential development immediately adjacent to the south and east of the site is first recorded in 1916 and remains largely unchanged to the present day.
- The reservoir to the west was infilled between 1968 and 1971 and formed into playing fields for the newly sited St Paul's Independent School which was developed across the former waterworks site to the west.

3.4 Ground Conditions

The published geology of the area is shown on the geological map for South London (Sheet 270, scale 1:50,000), published by the BGS. Derivatives of the BGS mapping are included in the Geology Report (Landmark). Further geological information has also been obtained from the BGS website.

The maps indicate that the majority of the Site is directly underlain by superficial deposits of Alluvium and River Terrace Deposits of Kempton Park Gravel on the north bank. Bedrock strata of London Clay is indicated to underlie the entire site.

Artificial ground is recorded by the BGS immediately west of the south bank site boundary and is believed to relate to the infilled former reservoir historically located to the west.

Description of Geological Strata

A site-specific ground investigation has not been carried out for the scheme. The ground model and properties presented below are based on the best available information obtained from the desk-based research (including Landmark records and historical borehole records).

Made Ground: Recorded in various BGS boreholes advanced in the proximity of the site, with the exception of the exploratory hole recorded for TQ27NW467 included above where the Made Ground is described as Chalk Bricks and rubble bound in a clay matrix, detailed description of Made Ground is generally absent and records are too distant from the site to be considered representative.

Alluvium: Alluvium is not recorded within any of the closest exploratory records. The closest exploratory hole indicating alluvium describes a layer of soft grey silty CLAY.

Kempton Park Gravel: The Kempton Park Gravel Formation was generally described as medium dense brown medium SAND and fine to medium GRAVEL.

London Clay Formation: The London Clay Formation was typically described as firm brown becoming stiff grey silty CLAY. Occasional claystone nodules were recorded in some of the historical BGS boreholes.

Summary of Anticipated Geology under the Site

The anticipated ground conditions under the Site are summarised in Table 1

Table 1 General Succession of Anticipated Strata

Strata	Top of the stratum (mAOD)	Thickness (m)
Made Ground	+5*	Up to 2.0
Alluvium	Not locally recorded	N/A
Kempton Park Gravel Formation	+3.0	Up to 5.0
London Clay Formation	0.0 to -2.0	Not proven

* Based on a generalised ground elevation across the Site.

3.5 Hydrogeology

The hydrogeological classifications for the underlying superficial deposits and solid geology (bedrock), taken from the Envirocheck Report are summarised in Table 2

Table 2 Hydrogeological Classifications and Characteristics of Strata

Stratum	Aquifer Designation	Hydraulic Characteristics (EA Descriptions)
Alluvium – ALV (Superficial)	Secondary Undifferentiated	“assigned in cases where it has not been possible to attribute either category A or B to a rock type. In most cases, this means that the layer in question has previously been designated as both minor and non-aquifer in different locations due to the variable characteristics of the rock type.”
Kempton Park Gravel – KPG (Superficial)	Secondary A	“Permeable layers capable of supporting water supplies at a local rather than strategic scale, and in some cases forming an important source of base flow to rivers. These are generally aquifers formerly classified as minor aquifers.”
London Clay – LC (Bedrock)	Unproductive strata	“These are rock layers or drift deposits with low permeability that have negligible significance for water supply or river base flow.”

The available BGS borehole records indicate that there is a limited presence of cohesive alluvium at the site and that the majority of superficial strata comprises sand and gravel likely to be River Terrace Kempton Park Gravel. Shallow groundwater below the site is likely to be present within these deposits and perched above the underlying London Clay. Groundwater within these strata is likely to be in hydraulic continuity with the adjacent River Thames and is likely to discharge to this surface water receptor.

The considerable thickness of the London Clay below the site precludes vertical migration of groundwater into the underlying Chalk aquifer, which, based on BGS borehole records, is recorded at a depth of at least 70m below the site.

The EA records within the Envirocheck Report indicate the following:

- The Site is not within a Source Protection Zone (SPZ);
- There are no groundwater abstraction licences within 1km of the site.
- The Site is in an area at risk of groundwater flooding ‘for properties situation below ground level, and is not within an area where groundwater flooding may occur at surface

3.6 Hydrology

The nearest known surface water feature is the River Thames which bisects the majority of the site between its north and south banks. The Envirocheck Report and EA data also indicate the following:

- There are no surface water abstractions within 1km, of the site.
- There is one surface water discharge consent on-site and one within 15m, both licensed to Thames Water for Sewage Discharge – Storm Overflow. Both are located on the Thames’ north bank.
- Thames Water hold a further 3 Discharge Consents within 1km of the site, all relate to Sewage Discharge to the River Thames. One further discharge consent held by The Hammersmith Business Park Unit Trust, exists 396m SE and downstream of the site.

The Envirocheck Report surface water flood risk map, indicates some flood risk in low-lying areas within the site, most notably at the southern end of Queen Caroline Street on the north bank. Further consideration of flood risk is beyond the scope of this technical note.

3.8 Environmental Data Searches

On-Site

Review of the Envirocheck Report did not identify any additional records of geoenvironmental significance on-site. In particular, the report indicates that there are no records of 'Contaminated Land Register' Entries on-site or within 1km and no current or historic landfills within or directly adjacent to the Site.

Off-Site

Based on a review of the Envirocheck Report - beyond the potentially contaminative activities already identified within the review of historic mapping, the Envirocheck report does not identify potentially contaminative land-uses within close proximity of the Site or within 250m.

No landfills or historic landfills are recorded within 1km of the Site. No active registered waste facilities are located within 1km of the site. Two historic licensed waste facilities are recorded, the closest described as a scrapyards formerly located 343m to the east.

3.10 Unexploded Ordnance

London was heavily targeted in terms of bombing during World War 2. A significant number of bombs did not detonate on impact and some of these bombs are still in the ground. Hence the potential presence of unexploded bombs may present a risk for construction works and residents/occupiers/users of the surrounding areas.

As an initial step towards a preliminary UXO risk assessment (in line with the CIRIA report C681, 2009), a non-specialist UXO screening exercise has been carried out for the Site, the following were noted:

- no historic military land-uses have been identified in proximity to the area from the historic maps and aerial photographs reviewed and described in the Site History section;
- An extract of the London County Council [WW2] Bomb Damage Maps 85 & 86, which indicates that only limited bomb damage, in the immediate surroundings of the site was recorded. The Bomb Sight website (<http://bombsight.org>) has also been consulted which plots all known aerial bombs that fell during the period of the London Blitz.
- The Bomb Sight maps indicate that at least five high explosive bombs fell within 150m of the site boundary, with the two closest recorded as falling approximately 90m to the north west and south east of the site.
- A UXB risk map for the site has been downloaded from Zetica, the map indicates a moderate to high potential bomb risk at the site.

3.11 Environmental Designations

The Envirocheck Report records two Local Nature Reserves located 911m and 943m west and southwest respectively.

The Barn Elms Wetland Centre located 611m south is a designated Site of Special Scientific Interest (SSSI).

No other environmentally sensitive designations have been identified.

Report Section 4 – Preliminary Land Contamination Risk Assessment

4.1 Introduction

A Preliminary Risk Assessment (PRA)³ has been undertaken to identify potential land contamination and/or geoenvironmental constraints which could impact upon and/or restrict the proposed development.

The main part of the PRA involves the development of a Conceptual Site Model (CSM). The CSM is a 'representation of the characteristics of the site in diagrammatic or written form that shows the possible relationships between contaminants, pathways and receptors'; (see definitions in **Table 3**). London

Table 3: Contaminant-Pathway-Receptor Definitions

Term	Definition
Contaminant	A substance in, on or under the land and which has the potential to cause significant harm to a relevant receptor, or to cause significant pollution to controlled waters.
Receptor	Something that could be adversely affected by a contaminant, for example a person, an organism, an ecosystem, property or controlled waters
Pathway	A route or routes by which a receptor is or might be affected by a contaminant.

The term ‘contaminant linkage’ (CL) is used to describe the relationship between a particular ‘contaminant-pathway-receptor’ combination. All three elements of a CL would need to be present for a land contamination risk to exist.

The contaminant linkages from the desk based review are compiled to form an ‘outline’ or ‘initial’ CSM. The CSM can then be used to inform the overall land contamination risk assessment process and to identify requirements for more detailed investigation. The CSM is subsequently refined or revised as more information and understanding is obtained.

4.4 CSM and Risk Assessment

Table 4 summarises the identified Contaminant Linkages (CLs) within The Report and displays a Conceptual Site Model for the Temporary Bridge scheme (from Table 10 of The Report):

Table 4 Initial Conceptual Site Model and Preliminary Risk Assessment

Source(s)	Possible Pathway(s)	Receptor(s)	Probability	Consequence	Risk Level	Comments
Contaminants within the Made Ground on-site (including potential infilled areas)	Ingestion, inhalation or direct dermal contact	End users	Unlikely	Medium	Very Low	Made Ground likely to be present on the north bank resulting from widescale demolition and site clearance as indicated from the site history. Limited Made Ground also anticipated on the south bank. Recommend: ground investigation including near surface soil sampling to enable the geochemical nature of these materials to be established and potential sources to be quantified and risk to be assessed.
		Site preparation workers	Highly Likely	Medium	High	
Asbestos containing soils (ACSSs)	Inhalation	End users	Unlikely	Medium	Very Low	Historic mapping indicating post war demolition and site clearance suggests that Made Ground is likely to be present on site. The dwellings previously occupying the site which date from pre 1871 are considered unlikely to have contained ACMs, however, wider site clearance was ongoing in the area over the same time and waste soils may have been moved onto site during this period. Recommend: ground investigation including near surface soil samples to screen for asbestos in soils.
		Site preparation workers	Highly Likely	Medium	High	
Ground gas (possible infilled ground or infilled off-site former reservoir with deleterious materials)	Inhalation of outdoor air (only)	End users	Unlikely	Medium	Very Low	It is not anticipated that significant ground infilling by readily biodegradable materials or waste is present on site. The end use exposure pathway will only apply to outdoor air as such there is very low risk from potential trace releases of ground gas in an open-air scenario. Recommend: monitor ground investigation exploratory hole findings for any domestic refuse or other biodegradable materials liable to generate ground gas with any significant methane or carbon dioxide.
		Site preparation workers	Low likelihood	Medium	Low	
Contaminants within the Made Ground (inc. hydrocarbons) or natural strata impacting controlled waters.	Migration through the unsaturated zone	Underlying groundwater - Secondary A aquifer and River Thames	Low Likelihood	Medium	Low	Beyond the very limited wharf-based activities believed to have occurred on site, very limited evidence exists to suggest that significant on-site contaminative activities have occurred. On this basis it is considered unlikely that significant quantities of leachable contaminants are present below the site and/or that on-site ground

Source(s)	Possible Pathway(s)	Receptor(s)	Probability	Consequence	Risk Level	Comments
						<p>conditions are leading to any deterioration in groundwater quality or impact on the adjacent River Thames surface water receptor.</p> <p>Recommend: ground investigation to determine the geochemical nature of the Made Ground and near surface soils and to observe the nature of shallow groundwater, if encountered.</p>
Migration of contaminants including hydrocarbons from off-site sources into the underlying ground and groundwater	Inhalation Ingestion, Inhalation or direct contact	End users	Unlikely	Medium	Very Low	<p>Adjacent and proximal land uses include an engineering works and former wharfs. An oil fuel tank is noted within the former Queen's Wharf engineering works 15m to the SE. Historic fuel spills from this site may have impacted the groundwater with the potential to migrate onto site. However, the nature of boiler fuel oils are typically not high volatility and risks via outdoor air exposure are likely to be extremely low. Site workers undertaking intrusive work may have a slightly high likelihood of possible exposure.</p> <p>Recommend: ground investigation to determine the geochemical nature of the underlying groundwater near to the historic location of the former off-site fuel tank and to observe the nature of shallow groundwater, if encountered.</p>
		Site preparation workers	Low likelihood	Medium	Low	

Based on the available data and proposed scheme detailed within the introduction, no additional CLs have been identified which are not already detailed within The Report Conceptual Site Model (CSM). Based on the differences between the current (ferry) and earlier (bridge) proposals, the identified risks presented within The Report are considered to cover those that may be present for the ferry proposal. In fact, the site boundary for the temporary ferry proposal covers a considerably smaller area on the north bank, being restricted to the southern end of Queen Caroline Street only and no longer includes areas of soft landscaping, these differences are likely to reduce the amount of construction workers interacting with the underlying Made Ground and effectively removes any viable post development exposure pathways to end users.

For the reasons detailed above, The Report is now considered slightly conservative with the overall balance of land contamination risks being somewhat lower for the currently proposed temporary ferry scheme. However, the differences are not considered so substantial to require significant change in the resulting recommendations which broadly align with conducting the construction works with due consideration of health and safety requirements for mitigating contamination risks to construction workers through appropriate working methods and use of PPE.

Report Section 5 – Conclusions and Recommendations

Given the differences in the current and previous proposals the recommendations within The Report can be revised. With respect to intrusive site investigation, this is no longer considered necessary to assess land contamination risks to end users given that the current proposals do not reveal any viable exposure pathways to end users. On this basis potential risks to this receptor group have largely been discounted. Site investigation is therefore now only recommended for where groundworks are likely to reveal below ground contamination whose risks cannot be adequately mitigated by standard PPE. Examples of such contamination might be the presence of buried asbestos or notable asbestos in soil.

If excavation and disposal of soils is likely to be required as part of the scheme, then waste classification will be required, and preconstruction waste classification based on site investigation data is recommended.

Previous recommendations in relation to groundwater quality and sampling are no longer considered applicable given the smaller site area on the north bank and the more limited engineering and piling works in this area that will be substantially reduced under the current proposals.

Recommendations for geotechnical site investigation are not included within The Report.

Report Section 6 – Uncertainties and Limitations

This section remains applicable to The Report.

Conclusion

The review of the current temporary ferry proposals have highlighted both differences and similarities with the previous temporary bridge proposals. In the context of land contamination preliminary risk assessment, the details of the current proposals do not deviate substantially from those for which the previous Land Contamination Desk Study report was written and as such with the addition of this technical note, the report can be considered broadly applicable to the new proposals.

Executive Summary

Site name	Hammersmith Temporary Pedestrian and Cycle Bridge
Location	The Site extends between Queen Caroline St in Hammersmith (north), across the River Thames and meets Hammersmith Bridge on Castelnau within Barnes (south). Approximate centre of the Site: National Grid Reference (NGR) 523011, 178080 Nearest postcodes: W6 9BX (north bank) and SW13 9QT (south bank).
Development proposals	Proposed Temporary Pedestrian and Cycle Bridge, that will be in use during the refurbishment works of Hammersmith Bridge, Grade II* Listed Building. The whole structure, including foundation elements and ramps, will be fully removed once the Hammersmith Bridge refurbishment is completed and reopened for cyclists and pedestrians.
Land use history	North bank: originally residential streets and housing, with adjacent wharfs on the banks of the Thames. Following post war clearance, the site was redeveloped as access roads and green space for the surrounding residential development. South bank: first developed as part of the Hammersmith Bridge (1824 and 1884), with a water works reservoir (west) which was subsequent subsequently redeveloped as school playing fields. Residential development to the south and east.
Published geology	Superficial deposits: Alluvium and Kempton Park Gravel Bedrock: London Clay Formation
Hydrogeology & hydrology	Alluvium: Secondary aquifer (undifferentiated). Kempton Park Gravel: Secondary A aquifer. London Clay: Unproductive strata.
Unexploded ordnance	Low to Medium risk zones identified within the proposed site boundary.
Preliminary Risk Assessment (PRA) conclusions	Due to the nature of the end use comprising access by existing hard-stood roads, footpaths and cycleways and the open air temporary bridge being elevated above the existing ground across the majority of its alignment, risks to end users of the development have been assessed as Low or Very Low. With respect to site preparation and construction workers, two potential contaminant linkages have been assigned a 'high' risk rating, associated with potential risks from elevated concentrations of contaminants (including asbestos) within the Made Ground on-site. These potential risks will need to be managed through appropriate risk assessments and a Construction Phase Plan One potential controlled waters contaminant linkage was identified as 'Low risk'.
Recommendations for further work	In order to assess the preliminary risks identified, limited intrusive site investigation followed by a Phase 2 Land Contamination Risk Assessment is recommended. Based on the above the following site investigation activities should be considered: <ul style="list-style-type: none"> • Soil sampling of shallow Made Ground, • Ground gas monitoring on the south bank, • Groundwater monitoring adjacent to Riverside Studios, and; • Groundwater monitoring at the riverside extent of the north bank.

1 Introduction

1.1 Introduction

This Phase 1 Land Contamination Desk Study (LCDS) has been prepared by Pell Frischmann (PF) on behalf of Transport for London (TfL), in support of full planning applications for a Temporary Pedestrian and Cycle Bridge spanning the River Thames between Hammersmith (to the north) and Barnes (to the south). This Temporary Bridge will lie to the east of the Grade II* listed Hammersmith Bridge which is closed to road traffic.

1.2 Background

Hammersmith Bridge was closed to road traffic indefinitely in April 2019, as it was found to have critical faults which required an immediate reduction in its live loading to prevent a catastrophic collapse.

Hammersmith Bridge provides a major link between Richmond and Hammersmith and beyond. For people living south of the River Thames it provides access to London Underground services at Hammersmith station. Until its closure four bus routes provided regular services across the bridge. Alternative crossing points are a significant distance away with Chiswick and Putney Bridges both being approximately 4km to the west and east respectively. (**Figure 1**)

Whilst Hammersmith Bridge remains open for pedestrians and cyclists the numbers have significantly increased with the termination of bus routes either end of the bridge. This situation is the subject of regular safety reviews which could result in the bridge being completely closed should the safety of users be compromised by a deterioration in the condition of the structure. There is consequently a need for a temporary crossing for pedestrian and cyclists in this location.

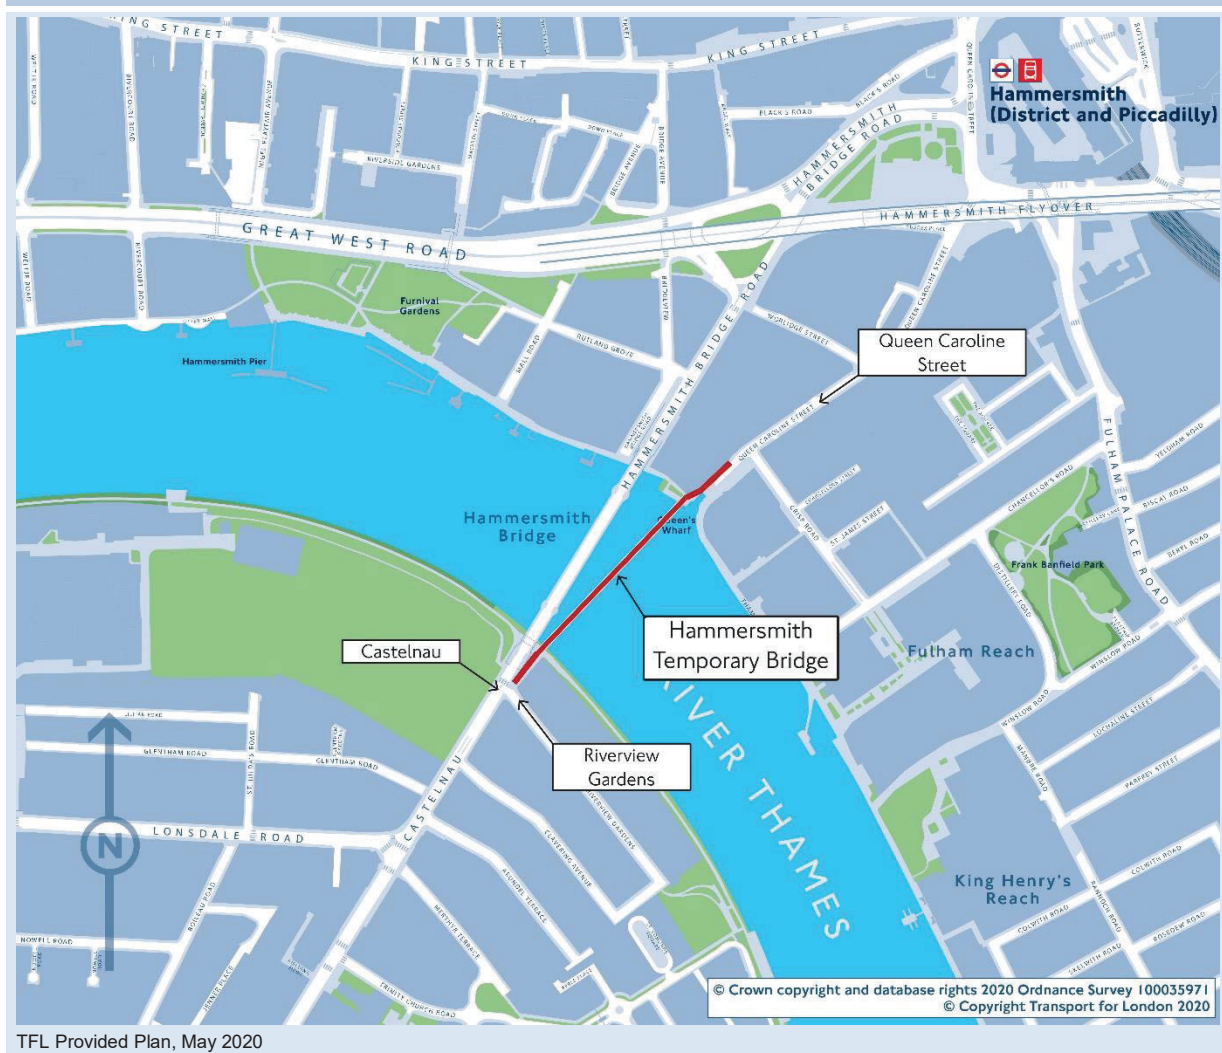

The objectives for this project are:

- To enable pedestrians and cyclists to be able to cross the River Thames safely during the restoration of the Hammersmith Bridge;
- To maintain connectivity across the River Thames in the vicinity of Hammersmith Bridge to allow uninterrupted crossing for pedestrians and cyclists until the restoration of the Hammersmith Bridge is complete; and
- To facilitate the efficient delivery of the restoration of Hammersmith Bridge.

1.3 The Scheme

The scheme comprises a Temporary Bridge (anticipated to be in place up to five years) to facilitate cycling and pedestrian movements across the River Thames between Hammersmith and Barnes (Richmond) whilst the Grade II* listed Hammersmith Bridge is closed. The Temporary Bridge will be removed upon the completion of the major repairs required to enable the Hammersmith Bridge to be fully reopened.

Figure 1: Location of proposed Temporary Bridge.

The construction of a Temporary Bridge supports the National Planning Policy Framework, the Mayor's Transport Strategy and London Plan, and at a local level the London Boroughs of Hammersmith and Fulham and Richmond's connectivity and movement policies, by providing a safe and usable structure for pedestrians and cyclists thus retaining cross river connections while the main bridge is closed and repaired.

The provision of a Temporary Bridge for the duration of the Hammersmith Bridge restoration supports the healthy streets approach by providing a safe, quiet, separated route for pedestrians and cyclists that is easy to use and designed with the needs of all users in mind.

1.4 Proposed Design

The proposed Temporary Bridge is a three-span modular steel structure supported on two piers in the River Thames (one within the LB of Richmond upon Thames and the other LB Hammersmith and Fulham) and two abutments (one on each side of the river). The total length of the Temporary Bridge will be approximately 290m (inclusive of ramps). The bridge will be segregated for cyclists and pedestrians, with lanes to be a minimum of 3m and 2m respectively.

Ramps will form the landing of the bridge on the north and south sides of the River Thames. The ramps will be constructed from fabricated structural steel on reinforced concrete pad foundations and compacted fill within a retaining wall structure. The grade of each ramp will be less than 1:20 or 5%.

The bridge deck will be constructed from the north side utilising a worksite extending from the River Thames over the southern end of Queen Caroline Street together with access, parking, servicing and landscaped areas of the Queen Caroline Estate. Following the construction of the abutments and river piers, the bridge deck will be pushed across the river towards the south side in sections and lowered into its final position on the piers and abutments.

Once the Temporary Bridge and ramps are complete (**Figure 2**, they will be tied into the existing pedestrian and cycle network to provide a seamless connection for pedestrians and cyclists. Seating will be provided at both ends of the Temporary Bridge. A temporary hard and soft landscaping scheme will be provided. The Thames Towpaths on both the north and south of the River Thames will be temporarily diverted during works but reopened during the operation of the temporary bridge.

Figure 2: Birds eye view of Hammersmith Bridge and proposed Temporary Bridge

As the bridge is to be temporary, all the elements are designed to be quickly installed and removed once the Hammersmith Bridge is refurbished and re-opened. Superstructure elements will be fully removed, including the bridge deck, abutments, ramps and pier structures. Most substructure works will be fully removed with only the river piles and abutment piled foundations terminated below ground level, protected and covered.

The carriageway, crossovers, footways, Thames Paths and street furniture affected by the works will be reinstated (unless otherwise agreed with the boroughs). Hard and soft landscaping will be reinstated in accordance with a Landscape Design Strategy. Details of the strategy can be found in the Design and Access Statement that forms part of this application.

1.5 Context

This LCDS includes a review of site specific and readily available desk-based geoenvironmental information and a walkover survey to facilitate an initial assessment of the likely ground and geoenvironmental conditions at the site and to identify potential land contamination risks and /or geoenvironmental constraints which may impact upon and/or restrict the proposed Temporary Bridge development. This LCDS includes a Tier 1: Preliminary Risk Assessment (PRA) for land contamination, which includes the development of an outline Conceptual Site Model (CSM).

The Temporary Bridge will land either side of the River Thames, into LB Hammersmith and Fulham on the north bank, and LB Richmond Upon Thames on the south bank. The northern end of the bridge structure (abutments and ramps) will land in a small green space at the south west end of Queen Caroline

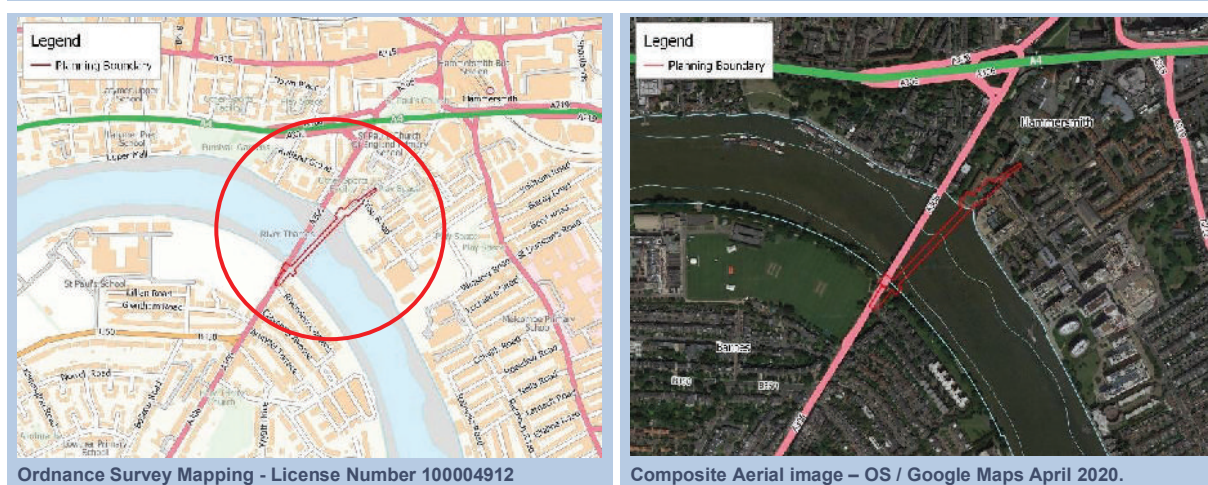

2 The Site

2.1 Site Location

The Site within west London, UK, extends between Queen Caroline St in Hammersmith to the north, across the River Thames and meets Hammersmith Bridge on Castelnau within Barnes to the south. The approximate centre of the Site is located at National Grid Reference (NGR) 523011, 178080 and the nearest postcodes are: W6 9BX (north bank) and SW13 9QT (south bank). The Site spans across two London Borough Local Authority districts: LB Hammersmith and Fulham in the north and LB Richmond in the south.

The Site location is shown in **Figure 4**.

Figure 4: Site Location Plan

2.2 Site Description

The Site occupies an area of approximately 0.57 hectares and lies at an elevation of between 4m to 6m AOD.

The site broadly follows a 370m linear alignment from southeast to northwest and on both south and north banks is located within a predominantly residential setting.

The north part of the site which comprises the greatest surface area beyond the Thames boundary, includes the southern section of Queen Caroline Street, adjacent landscaping and riverside frontage. The southern part of the site includes a relatively small section of landscaping adjoining Riverview Gardens before the site meets with the southern entrance to Hammersmith Bridge on Castelnau (A306).

The majority of the alignment is bound to the west and east by the River Thames and associated tidal foreshore.

2.3 Walkover Survey

Due to the 2020 Covid-19 related pandemic, national travel and working restrictions put in place by the UK Government shortly after instruction for this LCDS, a specific geoenvironmental walkover survey of the Site was not undertaken. However, site visits by other Pell Frischmann disciplines have previously been carried out as part of the scheme and a selection of site photographs taken during these visits are included as **Figure 5**.

Figure 5: Site Photographs

View from Hammersmith looking southwest towards Barnes along the proposed bridge alignment. River Thames foreshore at low tide in foreground.

View from Hammersmith Bridge looking northeast to Hammersmith and the newly developed Riverside Studios that sit behind the landing area of the proposed temporary bridge centre left.

View from Hammersmith Bridge looking southwest to Barnes and the landing area and southern abutment of the proposed temporary bridge in centre frame.

View northeast towards the southern end of Queen Caroline St from the north landing area of the proposed temporary bridge. The grassed area in the foreground will receive the bridge deck.

Looking north along the southern end of Queen Caroline St. The proposed bridge ramp will meet the street in centre frame.

Looking southwest from the Queen Caroline Street flood gates. The corner river wall in centre frame will accommodate the northern abutment of the proposed temporary bridge with the bridge ramp extending rightwards along the river wall before meeting the ground at street level.

Based on the existing photographs and feedback from staff having made previous site visits, specific indications of ground contamination risks were not identified within these visits.

2.4 Pre-Existing Reports

Table 1 summarises pre-existing reports which have been made available and reviewed as part of this desk-based review.

Table 1: Pre-existing Reports		
Report Title & Reference	Source	Date
Hammersmith Bridge Refurbishment, Desk Study Report 383488-MMD-HSB-DKS-SE-000001	Mott MacDonald	24 October 2018

The majority of the above Mott MacDonald report relates to the history and above ground structural elements of Hammersmith bridge. Very limited information is reported in respect to local ground conditions.

3 Environmental Data Search

3.1 Sources

The following 'desk-based' data sources have selectively been reviewed with respect to the geoenvironmental status and setting of the Site and its surroundings:

- Historic Ordnance Survey maps,
- Historic and current aerial photographs (Google Earth and Envirocheck),
- British Geological Survey (BGS) maps and records,
- Environment Agency (EA) data,
- EA River Basin Management Plans (RBMPs),
- Commission specific environmental database search results (Envirocheck), and
- Relevant internet-based data sources.

Relevant information is presented in the following sections and sub-sections of this report.

3.2 Environmental Database

As part of the data search an Envirocheck (Site Sensitivity) Report, Geology Datasheet and a set of historic maps have been procured from Landmark Information Group (Landmark). Copies of the Landmark products are included within **Appendix A**. Selected map extracts and relevant datasheet information summaries are included within the report text.

The key information topics included within the Envirocheck Report and Geology Datasheet are summarised in **Table 2**.

Table 2: Landmark Reports

Envirocheck Report incl. Site Sensitivity Maps	Geology Datasheet
<ul style="list-style-type: none"> • Environment Agency records, • Hydrology and hydrogeology, • Waste, • Hazardous substances, • Geological, • Industrial land uses, and • Sensitive land uses. 	<ul style="list-style-type: none"> • Artificial ground and landslip map, • Superficial geology map, • Bedrock and faults map, and • Combined geology map.

Pertinent information from the Landmark products has been considered in conjunction with the findings of the other desk study data sources and the collated findings are presented in the following sub-sections of this report chapter. Where Landmark information is referenced, the distances quoted to the identified features are from the nearest point of the subject site boundary, unless stated otherwise. The on-line Envirocheck Analysis tool has also been used to review, combine and extract relevant information from the Landmark products detailed above.

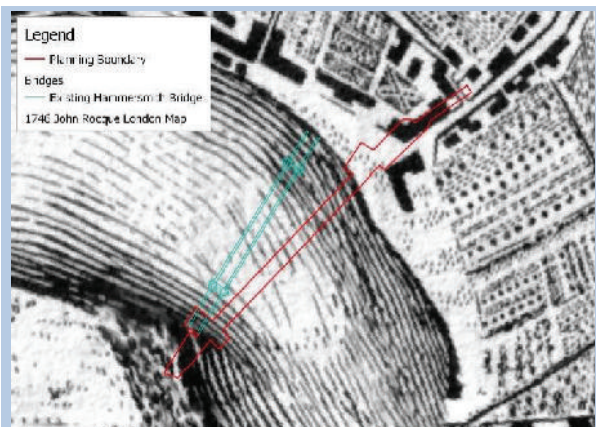

3.3 Site History

In order to provide an overview of the Site's history and to help identify potentially contaminative historic land uses both on-site and in the immediately surrounding area, the following historic records have been reviewed:

- Historic County Series and Ordnance Survey (OS) map editions (source: Landmark); and
- Historic and recent aerial photographs (source: Google & Landmark).

A summary of the Site's history is presented in **Table 3** including a small selection of map extracts. In some cases, the text in the table describes features from more than one map edition. In that case, the time range is shown and the year of the map extract presented (above the text) is included in blue. (Note: all distances quoted in **Table 3** are approximate).

Table 3: Site History

1746: The London 1746 map (published by the land surveyor John Rocque) indicates that the current Queen Caroline St was already built with indicative building locations marked within the site boundary on the north bank. The south bank of the site does not indicate any urban development.

Off-site, most of surrounding land use appears to comprise developed agricultural or orchard land.

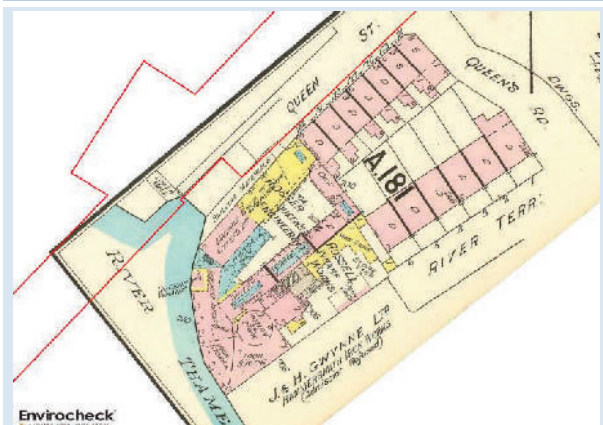

1869 (S) & 1871 (N): On-site the maps show Hammersmith Bridge (originally constructed 1824). The north bank has been developed, inc. residential dwellings along the present-day Queen Caroline St. The land use on the north bank foreshore is not described, but Chandler Wharf is shown immediately south. No notable development is indicated on the south bank.

Off-site, the land use on the north bank appears to comprise residential dwellings with wharfs on the river frontages to the south. On the south bank, a reservoir is shown to the east (part of the West Middlesex Water Works, constructed 1829) with undeveloped land to the west.

1896: On-site the map shows no notable changes. The new Hammersmith Bridge is shown (completed 1887) which shares the same alignment and foundation piers as its predecessor. No notable development is indicated on the south bank.

Off-site, the land use on the north bank is largely unchanged (wharfs to the SE are now named, inc. Queen's Wharf). Hammersmith Iron Works is shown 90m SE. A public house is shown on Queen Caroline St (immediately NW). Two foreshore overflows are shown NE of the Site. The only notable change on the south bank is the presence of a river channel structure

1901: This plan forms part of historic insurance assessment records for the off-site Queen's Wharf and indicates individual detail for the properties to the south of Queen Caroline St which immediately adjoin the site boundary. This plan indicates the north-eastern part of this property comprised residential dwellings while the south-western buildings towards the Thames waterfront are described as the Rosser & Russel Engineering Works containing machine shops, pattern shops and various material stores including for iron and paint.

named 'Hammersmith Pier' which bisects the site close to the southern shore.

1916: The map indicates that the north bank of the site is largely unchanged. Flood gates are now recorded on Queen Caroline St.

Off-site, the surrounding land use on the north bank is largely unchanged. On the south bank what appear to be residential properties have been built adjacent to the east and along the river frontage.

1933: The map records very little change from earlier mapping. Off-site, the Hammersmith Ironworks on the north bank 100m east of the Site is now referred to as Hammersmith Vestry Wharf. On the south bank the presence of Hammersmith Pier is no longer recorded, a laundry is recorded some 130m to the west. No other significant changes are evident.

1937: the aerial photograph provides a good view of the wharfs and residential dwellings within the site boundary on the north bank. Off-site, the imagery confirms the items described by the OS mapping.

1940: this 1940 ground level photo faces north from Barnes. The site boundary extends to the street level in the centre foreground of this image. Off-site, no relevant features noted.

1946: this aerial photograph provides a relatively clear view of this area of post war London. Most notable is the cleared ground to the east and west of the north western end of the site boundary surrounding Queen Caroline St in Hammersmith. The reasoning for the clearance is not directly obvious as the UXO assessment described in Section 3.10 does not suggest the area was subject to significant bomb damage.

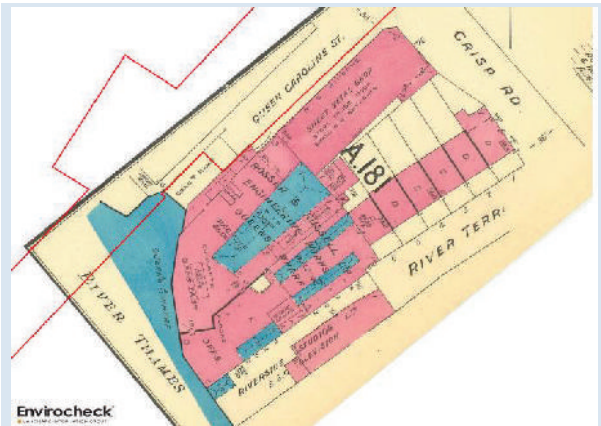

1952 (S) & 1951 (N): the maps continue to show residential properties in the north. The immediate river frontage is referred to as Becket's Wharf with Queen's Wharf (Engineering Works) recorded immediately off-site (east). No significant change is recorded on the south bank.

Off-site, on the north bank, the cleared land (east of the site) shown in the 1946 photograph has been developed as a residential estate, 'Caroline Estate'. The former 'Hammersmith Vestry Wharf' (east) is now named 'Riverside Studios'. No significant changes are noted on the south bank.

1958/71 (S) & 1957 (N): The maps show significant changes on-site (north bank). The residential terrace and Public House at the S end of Queen Caroline St have been cleared and the lower end of Queen Caroline St now loops round over this area forming a new access street that serves new residential blocks that border the northwest site boundary. The area of north bank river frontage is shown as a landscaped area. No significant changes are evident on the south banks.

Off-site, except for the north bank development, no further significant changes are apparent within the 1957/58 mapping.

1958: This updated 1958 insurance assessment record for the off-site Queen's Wharf indicates the engineering works to include a machine shop, sheet metal works and welding shop with offices. Within the centre of the works an Oil Fuel Tank and associated Oil boiler is recorded some 15m southeast of the site boundary from Queen Caroline St. The Riverside Studios to the southeast are recorded as BBC Television. No specific other features are recorded.

1974: The 1974 mapping shows no significant change on the north or south banks within the Site boundary.

Off-site, no significant changes are apparent on the north bank. On the south bank the reservoir to the east has been infilled and is now recorded as playing fields – likely part of the new St Paul's School recorded to the west. In the mapping above, a small tile of mapping from 1971 is included in the southwest and indicates that the reservoir has been infilled to form playing fields between 1968 (mapping not shown) and 1971.

1991: No significant changes are evident either on or off site.

2020 (left): The current mapping shows very limited change within the site boundary.

Off-site, the most significant change is the redevelopment of the former Queen's Wharf and adjacent Riverside Studios to the southeast. Dated Google satellite imagery confirms that the previous Queens Wharf and Riverside studios were demolished after 2014 and redeveloped between 2015 and 2018 to form the new Riverside Studios complex, a combined arts, studio and performance centre including extensive upper tier residential apartments.

Key: N north, E east, S south, W west, NE north east, NNE north north east etc. Inc. including

In summary, the historic maps and images indicate the following:

North Bank

- The north bank had already been developed within the site boundary by dwellings and riverside properties by the earliest mapping in 1746.
- The earliest OS mapping from 1871 indicates that most of the land within the north bank site boundary comprised residential dwellings and Queen Caroline Street, up until their clearance and the redevelopment of this area of the site between 1951 and 1957. The immediate riverside frontage is indicated to have periodically been used as wharfs.
- The clearance of the residential dwellings within site boundary followed wider post war clearance of property in the adjacent areas, and the north bank land within the site boundary was largely redeveloped as an access street serving new residential blocks to the northwest.
- The riverside frontage within the site boundary is indicated to have been converted to green space after 1957.
- Some form of wharf and later engineering works (Queen's Wharf) are shown to have been in existence directly adjacent to the southeast north bank site boundary from the mapping in 1869 until the recent redevelopment of Riverside Studios after 2014. The mapping and insurance records details the presence of a machine shop, sheet metal shop, stores, offices and an oil fuel tank within the works.
- The newly developed Riverside Studios were constructed along the southeast site boundary following the demolition of Queen's Wharf and the original adjacent Riverside Studios in 2014.

South Bank

- The south bank is not believed to have been subject to development until the construction of the original Hammersmith Bridge in 1824 whose southern extent fell within the south bank site boundary.
- The original bridge was replaced by the current Hammersmith Bridge in 1884 following the same alignment as its predecessor.
- In 1829, the land to the west was developed by the West Middlesex Water Works Company and a reservoir was constructed immediately west of the site.
- Residential development immediately adjacent to the south and east of the site is first recorded in 1916 and remains largely unchanged to the present day.
- The reservoir to the west was infilled between 1968 and 1971 and formed into playing fields for the newly sited St Paul's Independent School which was developed across the former waterworks site to the west.

3.4 Ground Conditions

3.4.1 Published Geology

The published geology of the area is shown on the geological map for South London (Sheet 270, scale 1:50,000), published by the BGS. Derivatives of the BGS mapping are included in the Geology Report (Landmark) and also shown in **Figure 6**. Further geological information has also been obtained from the BGS website.

Figure 6: Published Geology

Superficial Geology

Solid/Bedrock Geology

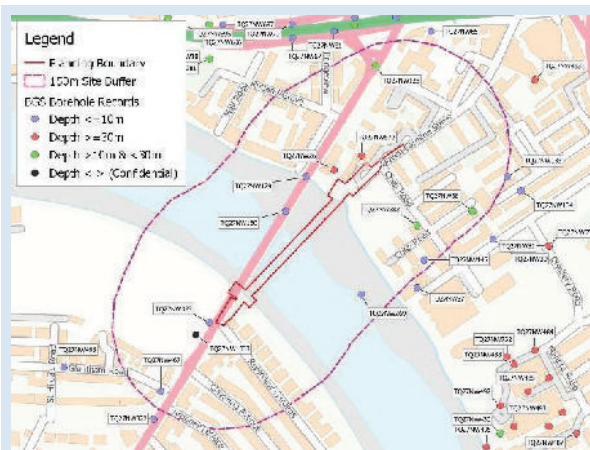

The maps indicate that the majority of the Site is directly underlain by superficial deposits of Alluvium and River Terrace Deposits of Kempton Park Gravel on the north bank. Bedrock strata of London Clay is indicated to underlie the entire site.

Artificial ground is recorded by the BGS immediately west of the south bank site boundary and is believed to relate to the infilled former reservoir historically located to the west.

The BGS maintains an archive of historic boreholes. The locations of the available borehole records (extracted from Envirocheck Analysis) are shown in **Figure 7**. There are records of 12 boreholes within 150m of the Site. The log for TQ27NW467 on the south bank is included in **Figure 7**.

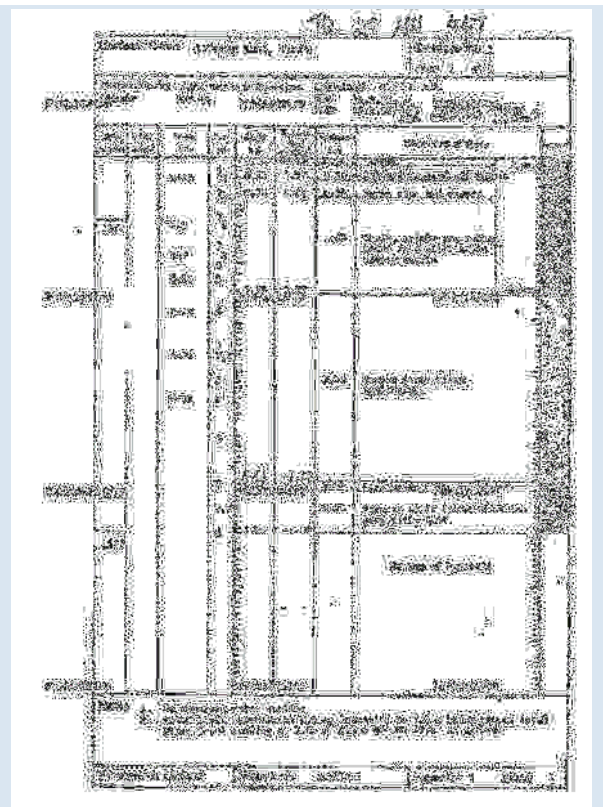

Figure 7: BGS Borehole Records

BGS Records

12 BGS borehole records are within 150m of the site. None of the records are located within site boundary. Only a limited number of the 12 exploratory hole records provide good quality detailed information regarding the ground conditions in the vicinity of the site, however, borehole TQ27NW467 (right) provides a representative indication of the anticipated ground conditions.

Example Exploratory Hole Record

The closest borehole records to the site do not generally provide detailed strata descriptions. The general indications of ground conditions confirmed by TQ27NW467 above and TQ27NW130 on the north bank predominantly indicate the presence of some 5-6m depth of granular superficial deposits described as sands and gravel over brown becoming blue/grey CLAY of the London Clay formation. The presence of cohesive alluvium is not widely recorded except in more detailed distant boreholes on the south bank.

3.4.2 Description of Geological Strata

A site-specific ground investigation has not yet been carried out for the Site. The ground model and properties presented in the following section are based on the best available information obtained from the desk-based research (including Landmark records and historical borehole records).

Made Ground: Recorded in various BGS boreholes advanced in the proximity of the site, with the exception of the exploratory hole recorded for TQ27NW467 included above where the Made Ground is described as Chalk Bricks and rubble bound in a clay matrix, detailed description of Made Ground is generally absent and records are too distant from the site to be considered representative.

Alluvium: Alluvium is not recorded within any of the closest exploratory records. The closest exploratory hole indicating alluvium describes a layer of soft grey silty CLAY.

Kempton Park Gravel: The Kempton Park Gravel Formation was generally described as medium dense brown medium SAND and fine to medium GRAVEL.

London Clay Formation: The London Clay Formation was typically described as firm brown becoming stiff grey silty CLAY. Occasional claystone nodules were recorded in some of the historical BGS boreholes.

3.4.3 Summary of Anticipated Geology under the Site

The anticipated ground conditions under the Site are summarised in **Table 4**

Table 4: General Succession of Anticipated Strata

Strata	Top of the stratum (mAOD)	Thickness (m)
Made Ground	+5*	Up to 2.0
Alluvium	Not locally recorded	N/A
Kempton Park Gravel Formation	+3.0	Up to 5.0
London Clay Formation	0.0 to -2.0	Not proven

* Based on a generalised ground elevation across the Site.

3.4.4 Ground Stability Records

The Landmark Envirocheck Report and Geology Datasheet indicates that two natural ground hazards have been recorded at moderate risk or above. Both hazards relate to the mapped presence of alluvium within the site boundary and record a high risk of compressible deposits and moderate risk of shrinking or swelling clay. Other natural ground stability hazards have a hazard rating of Low, Very Low or No Hazard.

Geological Hazards for the Site are summarised in **Table 5**.

Table 5: Natural Ground Stability Hazards

Natural Ground Stability Hazard	Hazard rating
Shrinking or swelling clay	Moderate (over alluvium) No Hazard (over KPG*)
Landslide	Very low
Running sands	Low (over alluvium) Very Low (over KPG*)
Compressible deposits	High (over alluvium) Very Low (over KPG*)
Collapsible deposits	No Hazard (over alluvium) Very Low (over KPG*)
Ground Dissolution	No hazard
Non-coal mining areas	No hazard
Coal mining affected areas	'In an area that might not be affected by coal mining'

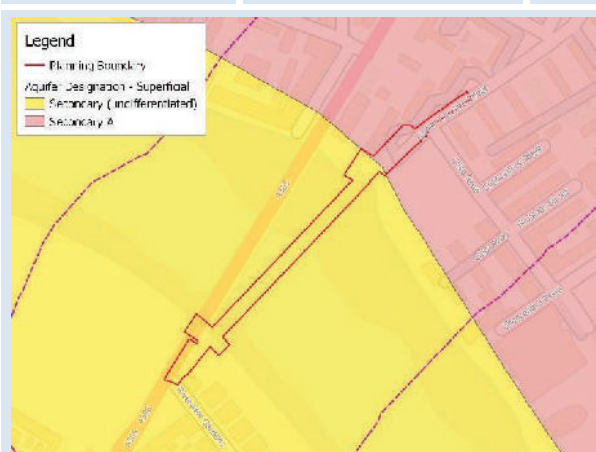

* Kempton Park Gravel

3.5 Hydrogeology

The hydrogeological classifications for the underlying superficial deposits and solid geology (bedrock), taken from the Envirocheck Report are summarised in **Table 6**.

Table 6: Hydrogeological Classifications and Characteristics of Strata

Stratum	Aquifer Designation	Hydraulic Characteristics (EA Descriptions)
Alluvium - ALV (Superficial)	Secondary Undifferentiated	“assigned in cases where it has not been possible to attribute either category A or B to a rock type. In most cases, this means that the layer in question has previously been designated as both minor and non-aquifer in different locations due to the variable characteristics of the rock type.”
Kempton Park Gravel - KPG (Superficial)	Secondary A	“Permeable layers capable of supporting water supplies at a local rather than strategic scale, and in some cases forming an important source of base flow to rivers. These are generally aquifers formerly classified as minor aquifers.”
London Clay - LC (Bedrock)	Unproductive strata	“These are rock layers or drift deposits with low permeability that have negligible significance for water supply or river base flow.”

Superficial aquifer classifications

Bedrock aquifer classifications

The available BGS borehole records indicate that there is a limited presence of cohesive alluvium at the site and that the majority of superficial strata comprises sand and gravel likely to be River Terrace Kempton Park Gravel. Shallow groundwater below the site is likely to be present within these deposits and perched above the underlying London Clay. Groundwater within these strata is likely to be in hydraulic continuity with the adjacent River Thames and is likely to discharge to this surface water receptor.

The considerable thickness of the London Clay below the site precludes vertical migration of groundwater into the underlying Chalk aquifer, which, based on BGS borehole records, is recorded at a depth of at least 70m below the site.

The EA records within the Envirocheck Report indicate the following:

- The Site is not within a Source Protection Zone (SPZ);
- There are no groundwater abstraction licences within 1km of the site.
- The Site is in an area at risk of groundwater flooding 'for properties situation below ground level, and is not within an area where groundwater flooding may occur at surface; as shown in **Figure 8**.

Figure 8: Groundwater Flooding Risk (Envirocheck)

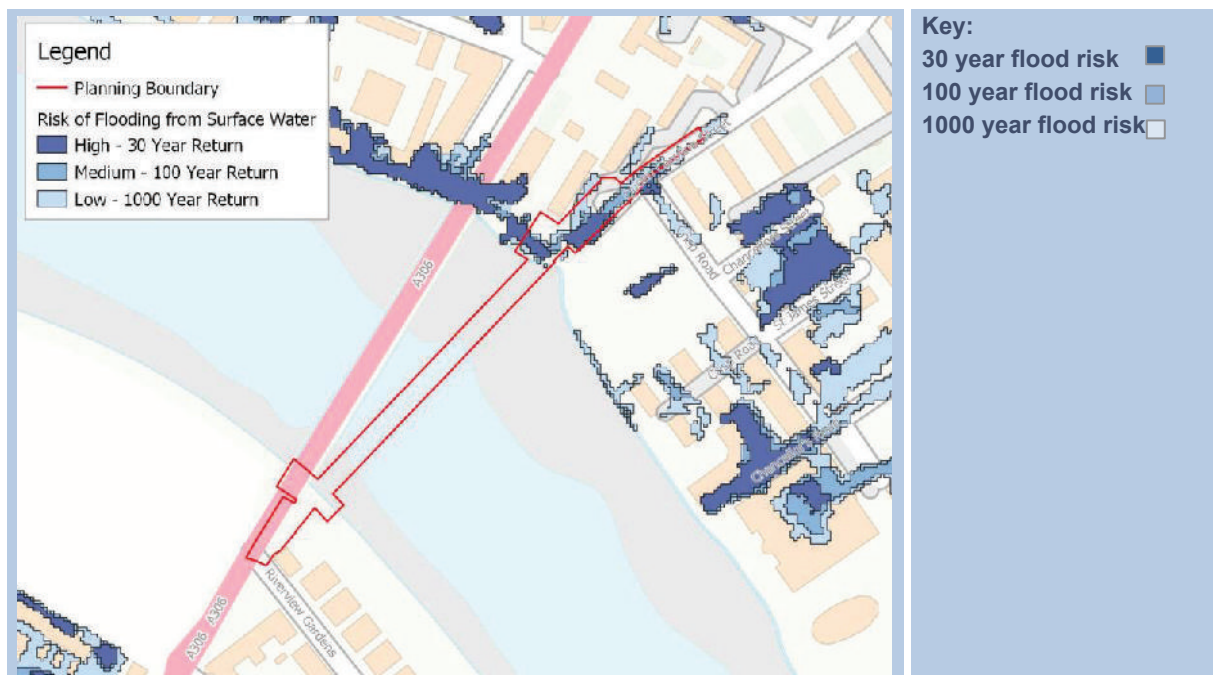

3.6 Hydrology

The nearest known surface water feature is the River Thames which bisects the majority of the site between its north and south banks. The Envirocheck Report and EA data also indicate the following:

- There are no surface water abstractions within 1km, of the site.
- There is one surface water discharge consent on-site and one within 15m, both licensed to Thames Water for Sewage Discharge – Storm Overflow. Both are located on the Thames' north bank.
- Thames Water hold a further 3 Discharge Consents within 1km of the site, all relate to Sewage Discharge to the River Thames. One further discharge consent held by The Hammersmith Business Park Unit Trust, exists 396m SE and downstream of the site.

The Envirocheck Report surface water flood risk map (extract included in **Figure 9**), indicates some flood risk in low-lying areas within the site, most notably at the southern end of Queen Caroline Street on the north bank. Further consideration of flood risk is beyond the scope of this report.

Figure 9: Surface Water Flood Extents

3.7 Radon

Reference to the UK Radon maps (www.ukradon.org) (and the Envirocheck Report) indicates that the Site is within an area where <1% of the homes are at or above the radon Action Level, based on 1 km squares. Subsequent reference to BR211 on Radon¹ indicates that the area is within an area where 'no radon protection measures are necessary in the construction of new dwellings or extensions'.

3.8 Environmental Data Searches

3.8.1 On-Site

Review of the Envirocheck Report did not identify any additional records of geoenvironmental significance on-site. In particular, the report indicates that there are no records of 'Contaminated Land Register' Entries on-site or within 1km and no current or historic landfills within or directly adjacent to the Site.

3.8.2 Off-Site

Based on a review of the Envirocheck Report - beyond the potentially contaminative activities already identified within the review of historic mapping, the Envirocheck report does not identify potentially contaminative land-uses within close proximity of the Site or within 250m.

No landfills or historic landfills are recorded within 1km of the Site. No active registered waste facilities are located within 1km of the site. Two historic licensed waste facilities are recorded, the closest described as a scrapyard formerly located 343m to the east.

3.9 London Underground and Rail

Based on TFL indicative geographic mapping of the London Underground Network, the site is shown to be located greater than 300m from the nearest London Underground line.

¹ BR211 Radon. Guidance on protective measures for new buildings, 2015 edition. Building Research Establishment.

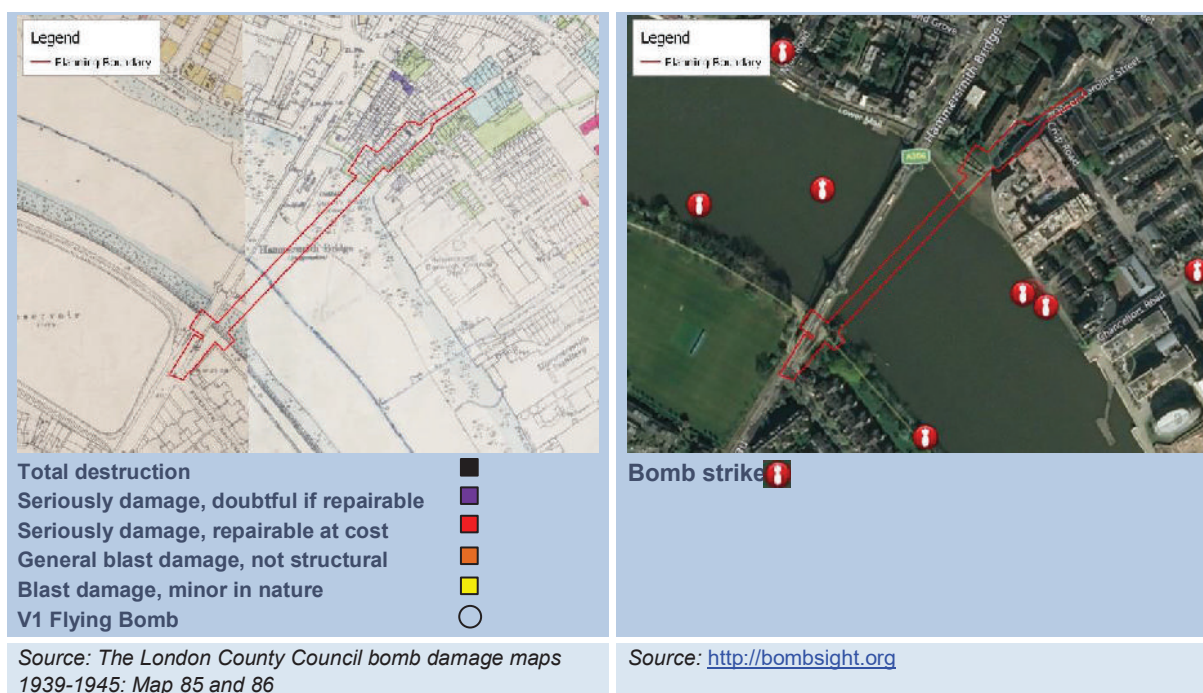

3.10 Unexploded Ordnance (UXO)

London was heavily targeted in terms of bombing during World War 2. A significant number of bombs did not detonate on impact and some of these bombs are still in the ground. Hence the potential presence of unexploded bombs may present a risk for construction works and residents/occupiers/users of the surrounding areas.

As an initial step towards a preliminary UXO risk assessment (in line with the CIRIA report C681, 2009), a non-specialist UXO screening exercise has been carried out for the Site, the following were noted:

- no historic military land-uses have been identified in proximity to the area from the historic maps and aerial photographs reviewed and described in **Section 3.3**;
- **Figure 10** includes an extract of the London County Council [WW2] Bomb Damage Maps 85 & 86, which indicates that only limited bomb damage, in the immediate surroundings of the site was recorded. The Bomb Sight website (<http://bombsight.org>) has also been consulted which plots all known aerial bombs that fell during the period of the London Blitz.
- The Bomb Sight maps indicate that at least five high explosive bombs fell within 150m of the site boundary, with the two closest recorded as falling approximately 90m to the north west and south east of the site.
- A UXB risk map for the site has been downloaded from Zetica², the map indicates a moderate to high potential bomb risk at the site.

Figure 10: Historic Bomb Records

² Zetica are a UK provider of services for managing the risk of UXO on land asset zeticauxo.com

PF commissioned a ‘Detailed Unexploded Ordnance Risk Assessment’ report by SafeLane Global (Ref. 8307RA) for the Hammersmith Bridge Refurbishment, which also covers the area of the Temporary Bridge. An extract of the Risk Map from the report is included in **Figure 10**, which identified medium and low risk zones within the proposed site boundaries. A copy of the report including a proposed risk mitigation strategy is included in **Appendix B**.

3.11 Environmentally Sensitive Designations

The Envirocheck Report records two Local Nature Reserves located 911m and 943m west and southwest respectively.

The Barn Elms Wetland Centre located 611m south is a designated Site of Special Scientific Interest (SSSI).

No other environmentally sensitive designations have been identified.

3.12 Summary of Previous Geoenvironmental Reports

As detailed with **Section 2.4**, no previous geoenvironmental reports have been provided or reviewed as part of this desk study.

3.13 Local Authority Search

In line with London Borough of Hammersmith and Fulham planning guidance, PF requested an ‘environmental search’ from LB Hammersmith and Fulham on 5 May 2020. LBHF aim to produce these reports within 10-days. However, on this occasion, PF have been advised that the report will not be ready for issue before mid-June 2020. Following review of the report provided by LB Hammersmith and Fulham, where relevant, any additional findings will be integrated into this LCDS and PRA. It is not currently anticipated that the environmental search will have a significant impact on the conclusions of this LCDS and/or the PRA as the majority of the records typically covered in the Local Authority search have already been acquired from an Industry Standard commercial provider and reviewed as part of this LCDS (including: historic maps, trade directory and land use records).

4 Preliminary Land Contamination Risk Assessment

4.1 Introduction

A Preliminary Risk Assessment (PRA)³ has been undertaken to identify potential land contamination and/or geoenvironmental constraints which could impact upon and/or restrict the proposed development.

The main part of the PRA involves the development of a Conceptual Site Model (CSM). The CSM is a 'representation of the characteristics of the site in diagrammatic or written form that shows the possible relationships between contaminants, pathways and receptors'³; (see definitions in **Table 7**).

Table 7: Contaminant-Pathway-Receptor Definitions⁴

Term	Definition
Contaminant	A substance in, on or under the land and which has the potential to cause significant harm to a relevant receptor, or to cause significant pollution to controlled waters.
Receptor	Something that could be adversely affected by a contaminant, for example a person, an organism, an ecosystem, property or controlled waters
Pathway	A route or routes by which a receptor is or might be affected by a contaminant.

The term 'contaminant linkage' (CL) is used to describe the relationship between a particular 'contaminant-pathway-receptor' combination. All three elements of a CL would need to be present for a land contamination risk to exist.

The contaminant linkages from the desk based review are compiled to form an 'outline' or 'initial' CSM. The CSM can then be used to inform the overall land contamination risk assessment process and to identify requirements for more detailed investigation. The CSM is subsequently refined or revised as more information and understanding is obtained.

4.2 Potential Contaminant Sources

Table 8 summarises the potential contaminant sources and/or potentially contaminative land-uses that have been identified on-site and/or in proximity to the Site, as part of the desk-based review.

Table 8: Potentially Contaminative Land-Uses

On-site	Off-site
<ul style="list-style-type: none"> Made Ground related to demolition of former on-site buildings and structures, most likely to be encountered on the north bank. Made Ground related to potentially infilled basements of former properties and the public house (both now cleared) within the southern portion of Queen Caroline St on the north bank. Potential ground contamination related to the north bank use as a wharf (including potential for the presence of hydrocarbons). Wastes formerly deposited on the Thames foreshore, also the potential presence of harmful microorganisms or pathogens associated with the proximity of the Thames Water storm sewage overflow immediately west of the site on the north shore. 	<ul style="list-style-type: none"> Fuel storage within former industrial buildings to the east of the site on the north bank (potential for the presence of hydrocarbons in soil and groundwater). Infilled reservoir 15m west of the site on the south bank (potential for ground gas generation dependent on infill material).

³ CLR11, Model Procedures for the Management of Land Contamination, Environment Agency, 2004

⁴ Environmental Protection Act 1990: Part 2A, Contaminated Land Statutory Guidance, Defra, 2012.

Based on the potentially contaminative land-uses summarised above the following contaminants should be considered when compiling future geochemical laboratory analysis suites:

Heavy metals/metalloids (including but not limited to arsenic, cadmium, chromium vi, copper, lead, mercury, nickel, selenium, vanadium and zinc), asbestos, sulphate/sulphide, and hydrocarbons (including total petroleum hydrocarbons and polycyclic aromatic hydrocarbons). Analysis suites should also include supporting information/determinands including pH, total organic carbon and loss on ignition.

4.3 Potential Receptors

In line with Defra’s Contaminated Land Statutory Guidance⁴, the following potential receptors have been identified with respect to the Site and the proposed end-use:

- Human health of the future end users;
- Human health of the site preparation and construction workers; and
- Controlled Waters, including local groundwater; and
- Local Nature Reserve.
- SSSI

The Local Nature Reserves are located over 900m from the Site and it is considered highly unlikely that any contaminative sources within the Site could have a significant impact on these receptors. On this basis the Local Nature Reserves are not included within the following CSM.

The Barn Elms Wetland Centre SSSI is located over 600m from the Site and has no direct water connection to the tidal River Thames, as such it is considered highly unlikely that any contaminative sources within the Site could have a significant impact on this receptor and on this basis the SSSI is not included within the following CSM.

4.4 CSM and Risk Assessment

An initial CSM for the Site is presented as **Table 10**. The status of CLs included in the CSM should only be considered as ‘potential’ CLs until the possible sources identified can be investigated to establish their presence/absence and/or significance.

As part of this PRA, a qualitative risk assessment has been undertaken for each CL. The assessment considers the product of the ‘severity of the consequence’ and the ‘probability of the likelihood’ as detailed in the Risk Matrix below (**Table 9**). The Risk Matrix is based on guidance within the CIRIA C552⁵ good practice guide. For ease of reference the resulting risk rating has been included in the CSM. The results of the qualitative risk assessment have been integrated into **Table 10**.

Table 9: Risk Matrix Key

<i>Product</i> <i>probability x consequence</i>		Consequence			
		Severe	Medium	Mild	Minor
Probability	High Likelihood	Very high risk	High risk	Moderate risk	Low risk

⁵ CIRIA C552, Contaminated land risk assessment, A guide to good practice (CIRIA), 2001.

Table 10: Initial Conceptual Site Model and Preliminary Risk Assessment

Source(s)	Possible Pathway(s)	Receptor(s)	Probability	Consequence	Risk Level	Comments
Contaminants within the Made Ground on-site (including potential infilled areas)	Ingestion, inhalation or direct dermal contact	End users	Unlikely	Medium	Very Low	Made Ground likely to be present on the north bank resulting from widescale demolition and site clearance as indicated from the site history. Limited Made Ground also anticipated on the south bank.
		Site preparation workers	Highly Likely	Medium	High	Recommend: ground investigation including near surface soil sampling to enable the geochemical nature of these materials to be established and potential sources to be quantified and risk to be assessed.
Asbestos containing soils (ACSS)	Inhalation	End users	Unlikely	Medium	Very Low	Historic mapping indicating post war demolition and site clearance suggests that Made Ground is likely to be present on site. The dwellings previously occupying the site which date from pre 1871 are considered unlikely to have contained ACMs, however, wider site clearance was ongoing in the area over the same time and waste soils may have been moved onto site during this period.
		Site preparation workers	Highly Likely	Medium	High	Recommend: ground investigation including near surface soil samples to screen for asbestos in soils.
Ground gas (possible infilled ground or infilled off-site former reservoir with deleterious materials)	Inhalation of outdoor air (only)	End users	Unlikely	Medium	Very Low	It is not anticipated that significant ground infilling by readily biodegradable materials or waste is present on site. The end use exposure pathway will only apply to outdoor air as such there is very low risk from potential trace releases of ground gas in an open-air scenario.
		Site preparation workers	Low likelihood	Medium	Low	Recommend: monitor ground investigation exploratory hole findings for any domestic refuse or other biodegradable materials liable to generate ground gas with any significant methane or carbon dioxide.
Contaminants within the Made Ground (inc. hydrocarbons) or natural strata impacting controlled waters.	Migration through the unsaturated zone	Underlying groundwater - Secondary A aquifer and River Thames	Low Likelihood	Medium	Low	Beyond the very limited wharf-based activities believed to have occurred on site, very limited evidence exists to suggest that significant on-site contaminative activities have occurred. On this basis it is considered unlikely that significant quantities of leachable contaminants are present below the site and/or that on-site ground conditions are leading to any deterioration in groundwater quality or impact on the adjacent River Thames surface water receptor.
						Recommend: ground investigation to determine the geochemical nature of the Made Ground and near surface soils and to observe the nature of shallow groundwater, if encountered.
Migration of contaminants including hydrocarbons from off-site sources into the underlying ground and groundwater	Inhalation Ingestion, Inhalation or direct contact	End users	Unlikely	Medium	Very Low	Adjacent and proximal land uses include an engineering works and former wharfs. An oil fuel tank is noted within the former Queen's Wharf engineering works 15m to the SE. Historic fuel spills from this site may have impacted the groundwater with the potential to migrate onto site. However, the nature of boiler fuel oils are typically not high volatility and risks via outdoor air exposure are likely to be extremely low. Site workers undertaking intrusive work may have a slightly high likelihood of possible exposure.
		Site preparation workers	Low likelihood	Medium	Low	Recommend: ground investigation to determine the geochemical nature of the underlying groundwater near to the historic location of the former off-site fuel tank and to observe the nature of shallow groundwater, if encountered.

4.5 Preliminary Risk Assessment Summary

The PRA has identified nine *potential* CLs in relation to the proposed Temporary Bridge, of which four relate to the final end-users, four relate to the health and safety of construction workers and one relates to controlled waters.

With respect to the final end-users, none of the four potential CLs have been assigned an initial risk rating, greater than 'Low risk'. These only occur due to the site boundary including existing soft cover landscaped areas where direct exposure to on-site soils might occur. Within the area of the proposed temporary bridge and its approaches, end users will typically be using hard-stood access roads and pathways or once using the bridge will be elevated above the underlying ground.

Risks relating to outdoor inhalation of possible ground gas and direct contact with contaminated groundwater have been discounted on the basis of a lack of viable exposure pathway due to substantial air dilution and lack of access to potentially impacted groundwater below the ground surface.

Two of the four potential CLs identified with respect to site preparation and construction workers during the construction phase have been assigned a 'high' risk rating, associated with potential risks from elevated concentrations of contaminants (including asbestos) within the Made Ground on-site. The appointed contractor will need to consider these potential risks and determine whether mitigation measures will be required as part of their risk assessments and CDM 2015 Construction Phase Plan.

One *potential* CL with respect to controlled waters was assigned a 'Low Risk', evidence of on-site contaminative activities is considered to be low and most likely to relate to Made Ground comprising demolition and construction materials with a low likelihood of significant leaching potential.

The PRA summarised above is based on the available data presented in this report and has been progressed using qualitative judgement only. Phase 2 Site Investigation and further risk assessment would be recommended to further evaluate the potential risks, to enable the CSM to be updated and to determine whether mitigation or remedial measures will be required.

5 Conclusions and Recommendations

5.1 Conclusions

The LCDS and PRA has identified nine *potential* contamination linkages (CLs) relating to the proposed development.

With respect to proposed end-users, none of the 4 potential CLs have been assigned a risk rating greater than 'Low risk',

With respect to potential CLs relating to site preparation and construction workers (in construction), two potential CLs have been assigned 'high' risk ratings and will require construction phase management in line with current statutory requirements and industry good practice. Appropriate method statements, PPE and correct working and construction phase health and safety management practices are likely to be sufficient to mitigate potential risks to site workers.

One potential controlled waters CL was identified at 'Low risk'.

Based on the PRA, it is considered highly unlikely that the Site would be classified as Contaminated Land under Part 2A of the Environmental Protection Act (EPA) 1990.

Given the preliminary risks identified in **Table 10**, a suitable ground investigation and generic assessment of the site investigation data will be required to establish which source-pathway-receptor linkages exist and whether any mitigation and/or remedial measures are likely to be required for the development.

5.2 Recommendations

In order to assess the preliminary risks identified above, intrusive site investigation followed by Phase 2 Land Contamination Risk Assessment (LCRA) would typically be undertaken. Based on the above the following site investigation activities should be considered:

- Soil sampling of shallow Made Ground in locations where intrusive groundworks are proposed or where soft cover public open space end use within the site boundary is to be continued.
- Ground gas monitoring on the south bank if the development is to include any enclosed above or below ground buildings or structures.
- Groundwater monitoring adjacent to the site boundary with Riverside Studios to determine if significant hydrocarbons are present from off-site sources.
- Groundwater monitoring at the riverside extent of the north bank to determine groundwater quality prior to it discharging to the River Thames.

6 Uncertainties and Limitations

This report has been prepared by Pell Frischmann with reasonable skill, care and diligence, and taking account of the manpower and resources devoted to it by agreement with the Client in accordance to the agreed scope of services.

This report has been prepared to provide pre-development geo-environmental recommendations for the construction of the Hammersmith Temporary Bridge. The report contents should only be used in that context and Pell Frischmann disclaims any responsibility to the client and others in respect of any matters outside the agreed scope of the work.

The report details the findings of work carried out by Pell Frischmann during a study period from April to May 2020. The report has been prepared on the basis of available information obtained during that study period. Information provided by the referenced third parties has been used in good faith and is taken at face value; however, Pell Frischmann cannot guarantee its accuracy or completeness.

Although every reasonable effort has been made to gather all relevant information within the context of the agreed scope of work, all potential environmental constraints or liabilities associated with the site may not have been revealed. Should additional Information become available (including new legislation and changed practices), after the date of the report submission, Pell Frischmann reserves the right to reconsider the recommendations and alter the report accordingly.

Notwithstanding any site observations concerning the presence or otherwise of archaeological sites, asbestos-containing materials or invasive weeds such as Japanese knotweed, this report does not constitute a formal or specific survey of these potential development hazards. Unless otherwise stated, no assessment has been made for the presence of radioactive substances or unexploded ordnance.

Introduction

The Environment Act 1995 has made site sensitivity a key issue, as the legislation pays as much attention to the pathways by which contamination could spread, and to the vulnerable targets of contamination, as it does the potential sources of contamination. For this reason, Landmark's Site Sensitivity maps and Datasheet(s) place great emphasis on statutory data provided by the Environment Agency/Natural Resources Wales and the Scottish Environment Protection Agency; it also incorporates data from Natural England (and the Scottish and Welsh equivalents) and Local Authorities; and highlights hydrogeological features required by environmental and geotechnical consultants. It does not include any information concerning past uses of land. The datasheet is produced by querying the Landmark database to a distance defined by the client from a site boundary provided by the client. In this datasheet the National Grid References (NGRs) are rounded to the nearest 10m in accordance with Landmark's agreements with a number of Data Suppliers.

Index Map

For ease of identification, your site and buffer have been split into Slices, Segments and Quadrants. These are illustrated on the Index Map opposite and explained further below.

Slice

Each slice represents a 1:10,000 plot area (2.7km x 2.7km) for your site and buffer. A large site and buffer may be made up of several slices (represented by a red outline) that are referenced by letters of the alphabet, starting from the bottom left corner of the slice "grid". This grid does not relate to National Grid lines but is designed to give best fit over the site and buffer.

Segment

A segment represents a 1:2,500 plot area. Segments that have plot files associated with them are shown in dark green, others in light blue. These are numbered from the bottom left hand corner within each slice.

Quadrant

A quadrant is a quarter of a segment. These are labelled as NW, NE, SW, SE and are referenced in the datasheet to allow features to be quickly located on plots. Therefore a feature that has a quadrant reference of A7NW will be in Slice A, Segment 7 and the NW Quadrant.
